Personal Portfolio Website – Project Documentation

Author: Ch Anusha Raj **Program:** HTML & CSS Internship Project (EWB Courses)
Technologies: HTML5 and CSS3 only **Files:** index.html, style.css, README.txt

1. Introduction

This project is a responsive personal portfolio website. It introduces the author, a B.Tech Computer Science and Engineering student, and presents education, skills, projects and contact details in one clean page. It was built with semantic HTML5 and styled with a separate CSS file, without JavaScript, frameworks, a backend or a database.

2. Objectives

- Structure a web page with HTML5 semantic elements.
- Use CSS selectors, the box model, spacing, typography and colours.
- Arrange content with Flexbox and CSS Grid.
- Make the page usable on mobile, tablet and desktop screens.
- Test and organise the project files for submission.

3. Website Structure

Section	Purpose
Header / Navigation	Name as logo and links to Home, About, Skills, Projects and Contact
Home (Hero)	Name, career goal, short introduction and buttons to Projects and Contact
About Me	Biography, education and career interests
Skills	Six skill chips: C Programming, HTML5, CSS3, JavaScript (Basics), Data Structures, VS Code
Projects	Six project cards, each with title, description and technologies
Contact	Email, LinkedIn and GitHub links, and a demo contact form

Section	Purpose
Footer	Copyright line and name

4. Projects Shown

1. **Portfolio Website** – responsive personal site (HTML, CSS).
2. **Jio Saavn Clone** – music streaming interface with song list and playback controls (HTML, CSS, JavaScript).
3. **Student Management System** – application to organise student records.
4. **Attendance Table** – table layout for tracking attendance.
5. **Sankranti Application** – festive themed web application.
6. **Vemu Website** – informational multi-section website.

5. Design Decisions

- **Colour palette:** teal primary (#007180), bright teal accent (#00b8a3), dark navy (#0b1530) for header and footer, and a light teal background (#eef9fa). The palette is stored in CSS variables.
- **Typography:** Arial for readability, with a clear heading hierarchy (h1 for the name, h2 for sections, h3 for cards).
- **Layout:** Flexbox is used for the header, hero, skill chips and buttons. CSS Grid with auto-fit columns is used for the About and Project cards.
- **Visual hierarchy:** alternating section backgrounds, an accent underline under each heading, and left-bordered cards.

6. Features

- Sticky navigation bar with anchor links that jump to each section ID.
- Smooth scrolling and scroll offset so headings are not hidden under the header.
- Hover and focus effects on navigation links, buttons, project cards, skill chips and form fields.
- Media query for screens up to 600px wide: stacked header, centred hero and reduced spacing.
- Contact form shown as a visual demo only; it does not send any data.

7. HTML and CSS Requirements Met

Requirement	How it is met
Valid HTML5 structure	DOCTYPE, html, head and body present
Title, encoding, viewport	Set in the head
Semantic tags	header, nav, main, section, article, footer
Separate CSS file	style.css linked from index.html
CSS variables	Main colours defined in :root
Flexbox or Grid	Both used
Media query	max-width: 600px
Hover and focus states	Links, buttons, cards, inputs
No JavaScript	None used

8. Testing

The following checks should be done before submission:

- Open index.html in Chrome or Edge and click every navigation link.
- View the page at desktop width and at a narrow mobile width (browser developer tools, about 375px).
- Confirm there is no horizontal scrollbar and the text is readable.
- Check spelling, colours, contrast and spacing.
- Capture one desktop screenshot and one mobile screenshot.

9. Folder Structure

```
Anusha_HTML_CSS_Portfolio/
  index.html
  style.css
  images/
  README.txt
```

10. Future Improvements

- Add a profile photo with alt text.

- Replace the placeholder LinkedIn and GitHub links with real profile URLs.
- Add real project links and screenshots to each project card.
- Host the site (for example on GitHub Pages) and include the public link.

11. Conclusion

The project delivers a complete, responsive and well-organised portfolio using only HTML5 and CSS3. It helped practise semantic structure, styling, layout with Flexbox and Grid, and responsive design, and it can be extended as the author gains more skills and projects.
